Driving cost savings for a multinational manufacturing business

The challenge

Our client had on-premises legacy systems that required ongoing maintenance and limited its ability to support digital and cloud transformation. Managing servers and ensuring up-time was costly and our client wanted to upgrade Identity and Access Management (IAM) infrastructure to combat advanced cyber threats.

The solution

- Delivered a detailed assessment of IAM integrations, with migration impact and feasibility study

- Created a unified IAM architecture blueprint to support multi-cloud transformation strategy

- Adopted Agile methodology to rapidly migrate five IAM solutions to Microsoft IAM platform, featuring Microsoft Identity Manager and Azure Active Directory

Outcomes

99.95% Uptime for identity services

120+ servers and 20+ directories and databases decommissioned for significant cost saving

Cloud-ready IAM architecture to support ongoing digital transformation journey
